ART UNIT

PAPER NUMBER

2617

MAIL DATE

DELIVERY MODE

07/15/2009

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No.	Applicant(s)	
	10/596,619	NYSTROM ET AL.	
	Examiner	Art Unit	
	ISAAK R. JAMA	2617	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 30 March 2009.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-65 is/are pending in the application.
- 4a) Of the above claim(s) 1-32 is/are withdrawn from consideration.
- 5) ☒ Claim(s) 65 is/are allowed.
- 6) ☐ Claim(s) 33-50 and 52-64 is/are rejected.
- 7) ☒ Claim(s) 51 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Arguments

1. Applicant's arguments with respect to claims 33-64 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 33, 50, 52, 55, 57, 60 and 63 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent Number 7,184,703 (Naden et al.) in view of U.S. Patent Number 7,085,314 (Zhu et al.).
4. Regarding claims 33, 50, 52, 55, 57, 60 and 63, Naden teaches a wireless relay based network, comprising: a first node **[Figure 4, # 2, source]**; at least one relay station **[Figure 4, #s 12, 14 and 16, Relays 1, 2 and 3]**; and a second node **[Figure 4, # 4, destination]**; wherein said first node communicates with said second node via said at least one relay station **[Column 2, lines 44-46]**, wherein each relay station is operative to: receive a digital communication from said first node **[Column 2, lines 36-42]**. But Naden fails to explicitly teach computing a plurality of reliability values for a plurality of symbols in the received digital communication and the reliability information is transmitted to the second node. Zhu teaches a method and apparatus for reducing signal degradation in a received signal **[Title]**, whereby a method of modifying the

Art Unit: 2617

values of a plurality of digital filter coefficients for use by a digital filter which is a component of a relay station, the relay station successively receiving a first signal, modifying the first signal using the digital filter to form a second signal, and transmitting the second signal with amplification **[Column 2, lines 36-42]**. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to incorporate the method of Zhu into the relay system of Naden in order to reduce the deterioration of a transmitted signal.

5. Regarding claim 50, Naden further teaches that when one relay station transmits multiple digital communications at different times then said second node combines the transmitted digital communications **[Figure 2, column 11, lines 5-20]**.

6. Regarding claim 57, Naden further teaches that the relay station is used in a wireless multi-hop network **[Column 2, lines 28-32]**.

7. Claims 34, 36, 37, 53, 54, 61 and 62 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent Number 7,184,703 (Naden et al.) in view of U.S. Patent Number 7,085,314 (Zhu et al.) and further in view of U.S. Patent Number 7,236,591 (Sim).

8. Regarding claims 34, 54 and 62 Naden and Zhu teach the limitations of claims 33, 52 and 60 above. But Naden and Zhu fail to teach is the use of a maximum a posteriori (MAP) filter that computes reliability values for code symbols based on a code structure of the received digital communication. Sim teaches a method for performing turbo decoding in mobile communication systems whereby in order that the input code words iteratively pass through two convolutional decoders, the two convolutional

Art Unit: 2617

decoders should have output values corresponding to soft decision values having a probability rate of "0" or "1," not hard decision values such as "0" or "1." To obtain such soft decision values, a Maximum a Posteriori (MAP) decoding method is used, in which a posteriori probability value of a data bit is calculated and the data bit is decoded to obtain the maximum posteriori probability value **[Column 1, lines 32-40]**. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to incorporate the method of Sim into the combined system of Naden and Zhu in order to measure the likelihood that the received bit a soft bit, i.e. a 0 or 1.

9. Regarding claim 36, Naden and Zhu teach the limitations of claim 33, above. But Naden and Zhu fail to teach that each relay station performs the computing operation using a soft output channel decoder that computes reliability values for information symbols based on a code structure of the received digital communication. Sim teaches that in order to obtain soft decision values, a Maximum a Posteriori (MAP) decoding method has been suggested, in which a posteriori probability value of a data bit is calculated and the data bit is decoded **[Column 1, lines 36-38]**. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to incorporate the method of Sim into the combined system of Naden and Gilhousen in order to obtain the maximum posteriori probability value.

10. Regarding claims 37, 53 and 61, Naden and Zhu teach the limitations of claim 36, 52 and 60 above. But Naden and Zhu fail to teach a soft output channel decoder employs: a maximum a posteriori (MAP) algorithm; a soft output Viterbi algorithm (SOVA); a Log-MAP algorithm; or, a Max-LOG-MAP algorithm. Sim teaches that the

Art Unit: 2617

primary decoding and the secondary decoding are iterated for a certain number of times using a Maximum a Posteriori (MAP) algorithm, so as to reduce the receiving error rate **[Column 3, lines 24-27]**. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to incorporate the method of Sim into the combined system of Naden and Zhu in order to obtain the logarithm of the ratio of the a posteriori probability of each bit.

11. Regarding claim 35, Naden further teaches that each MAP filter also filters the received digital communication and redistributes noise to unreliable parts in the transmitted digital communication **[Column 3, lines 21-26; Naden discloses that the relay equipment selects from the plurality of signals they receive from source equipments those which are of the highest quality in terms of (SINR), (CINR) or RSS to relay to destination equipments thereby minimizing noise amplification]**.

12. Claims 38-43 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent Number 7,184,703 (Naden et al.) in view of U.S. Patent Number 7,085,314 (Zhu) and further in view of U.S. Patent Number 5,115,224 (Kostusiak et al.).

13. Regarding claims 38-43, Naden and Zhu teach the limitations of claim 33, above. But Naden and Zhu fail to teach that the computed reliability values are embedded in the transmitted digital communication. Kostusiak teaches a personal security system network whereby each receiving transceiver will transmit a relay signal, which combines (i.e. embeds) the emergency signal with additional received-signal-strength indication (RSSI) information **[Column 3, lines 37-39]**. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to incorporate the

Art Unit: 2617

method of Kostusiak into the combined system of Naden and Zhu in order to ascertain how far the transmitting unit is from the receiving unit.

14. Claims 44-49, 58 and 59 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent Number 7,184,703 (Naden et al.) in view of U.S. Patent Number 7,085,314 (Zhu) and further in view of the Applicant's admitted prior art.

15. Regarding claims 44-49, Naden and Zhu teach the limitations of claim 33, above. But Naden and Zhu fail to teach that first node is: a base station; a mobile station; or, a relay station; second node is: a base station; a mobile station; or, a relay station; each relay station is: a base station; a mobile station; or, a stand alone relay station; that the received digital communication is: an uplink received digital communication; a downlink received digital communication; a base station peer-to-peer received digital communication; or, a mobile station peer-to-peer received digital communication, and that the transmitted digital communication is: an uplink transmitted digital communication; a downlink transmitted digital communication; a base station peer-to-peer transmitted digital communication; or, a mobile station peer-to-peer transmitted digital communication. Applicant's admitted prior art discloses that relay based networks include one station (node A) that transmits information in coded and modulated digital communications to another station (node B) via one or more relay stations (RSs). The relay station can be part of a base station (BS), a mobile station (MS) or a stand-alone relay station. The nodes A and B can be a BS, a MS and/or a relay station. And, the digital communications could be either uplink communications (link from MS to BS), downlink communications (link from BS to MS), MS to MS communications or BS to BS

Art Unit: 2617

communications **[Page 1, paragraph 0004]**. and in regard to claim 49, the Applicant's admitted prior art teaches that when multiple relay stations each transmit the digital communication then said second node combines the transmitted digital communications **[Figure 5; #s 506 (a) and (b) and 504, pages 1 &2, paragraph 0009]**. In addition, and in regard to claim 58, the Applicant's admitted prior art teaches that the second link generally has a larger bandwidth and uses a different air interface protocol than the first link **[Page 1, paragraph 0008]**. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to have that the relay based networks include one station that communicates with another via a relay that may be a mobile, a base station or an stand-alone repeater, and to have the receiving node combine multiple relay signals. And that the bandwidth allotted between the relay and the destination node is greater than the bandwidth between the transmitting node and the relay in order to accommodate any additional information that may be required by the receiving node.

16. Claims 56 and 64 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent Number 7,184,703 (Naden et al.) in view of U.S. Patent Number 7,085,314 (Zhu) and further in view of U.S. Patent Number 7,130,601 (Khorram).

17. Regarding claims 56 and 64, Naden and Zhu teach the limitations of claims 33, 52 and 60 above. But Naden and Zhu fail to teach that the computed reliability values are implicitly embedded in the coded/modulated digital communication transmitted to the second node. Khorram discloses a method for determining received signal strength in a direct conversion receiver whereby the RSSI value (reliability value) includes the

Art Unit: 2617

amplitude modulation **[Figures 4-7, Column 6, 63-65]**. Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to incorporate the method of Khorram into the combined system of Naden and Zhu in order to transmit a more robust signal to the receiving node.

Allowable Subject Matter

18. Claim 51 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

20. Claim 65 is allowed.

21. The prior art made of record and relied upon by the Examiner in the prosecution of this Application fails to teach or even suggest “when one relay station knows a channel response of a link between that relay station and said second node then that relay station is able to construct a transmitted digital communication which is coherently combined at said second node with a similar transmitted digital communication received from another relay station” which is recited in claims 51 and 65.

Conclusion

19. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. U.S. Patent Application Publication Number 2003/0124976 (Tamaki et al.) teaches a multipoint wireless transmission repeater system and wireless equipments. European Patent Application Number EP 1 087 559 A1 (Shibuya) teaches a canceller for jamming wave by interference.

Art Unit: 2617
